

Pushing Agents

The default Colosseum configuration does not have any security tools deployed. The SIEM is receiving Full Packet Capture (FPC), and nothing else.

Users can push the following configurations:

- Deploy the Security Onion Elastic Agent
- Deploy the Carbon Black EDR Agent
- Deploy the Velociraptor EDR Agent
- Install Sysmon
- Push pfSense firewall syslog to the SIEM

Each of these tasks is easily accomplished using Ansible

Deploying Elastic, Sysmon, Velociraptor and Carbon Black takes roughly 5 minutes when following the procedure below.

WinRM requires the VM to be stable for at least a few minutes. If you try to execute the Ansible deployment scripts and you receive an error that the VM cannot be contacted, it could be caused by the VM being recently booted. Wait at least 2 minutes before trying Ansible again.

Pre-Deployment Checks WIP

Prior to deploying any agents refer to the following deployment guides and make sure all configurations have been made so the ansible scripts don't fail during deployment process.

- Deploying - Elastic Agent
- Deploying - Sysmon
- Deploying - Velociraptor
- Deploying - Carbon Black
- Forward pfSense syslog to SIEM

Tool Deployment Process

- Console onto the Ansible VM (located in the Networking Folder)
 - Username: coreadmin
 - Password: cyber!23
- Launch terminal
- cd Desktop/Colosseum
 - ansible-playbook deploy-elastic-agent.yaml
 - ansible-playbook deploy-sysmon.yaml
 - ansible-playbook deploy-velociraptor-agent.yaml
 - ansible-playbook deploy-carbon-black-agent.yaml
